Class 11: Halloween Project

Rogelio Castro

In today's class we will examine 558 candy data and see if this helps us___ some more feeling for how PCA and others methods work.

```
candy <- read.csv ("candy-data.txt", row.names=1)
head(candy)
```

```

```

Q1. How many different candy types are in this dataset?

```
nrow(candy)
```

```
[1] 85
```

Q2. How many fruity candy types are in the data set?

```
sum(candy$fruity)
```

```
[1] 38
```

Q. What are these fruity candy?

```
rownames(candy[ candy$fruity == 1, ])
```

```
 [1] "Air Heads"                    "Caramel Apple Pops"
 [3] "Chewey Lemonhead Fruit Mix"   "Chiclets"

[37] "Warheads"                     "Welch's Fruit Snacks"
```

How often does my favorite candy win?

Q3. What is your favorite candy in the dataset and what is it's winpercent value?

```
candy ["Almond Joy",]$winpercent
```

```
[1] 50.34755
```

Q4. What is the winpercent value for "Kit Kat"?

```
candy ["Kit Kat",]$winpercent
```

```
[1] 76.7686
```

Q5. What is the winpercent value for "Tootsie Roll Snack Bars"?

```
candy ["Tootsie Roll Snack Bars",]$winpercent
```

```
[1] 49.6535
```

```
library("skimr")
skim(candy)
```

pricepercent	0	1	0.47	0.29	0.01	0.26	0.47	0.65	0.98	
winpercent	0	1	50.32	14.71	22.45	39.14	47.83	59.86	84.18	

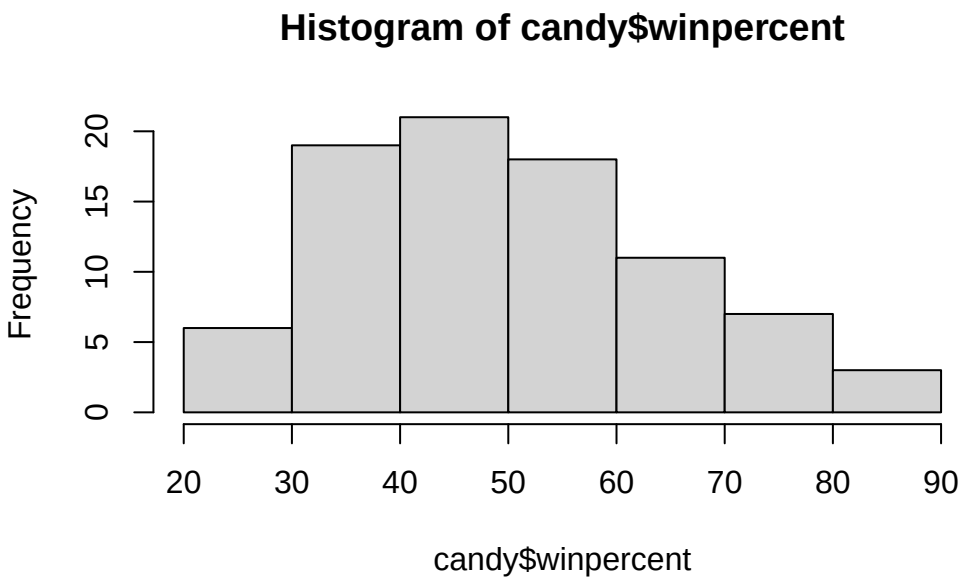
Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset?

Yes, the `winpercent` column is on a 0:100 scale and all others appear to be 0:1 scale.

Q7. What do you think a zero and one represent for the candy$chocolate column?

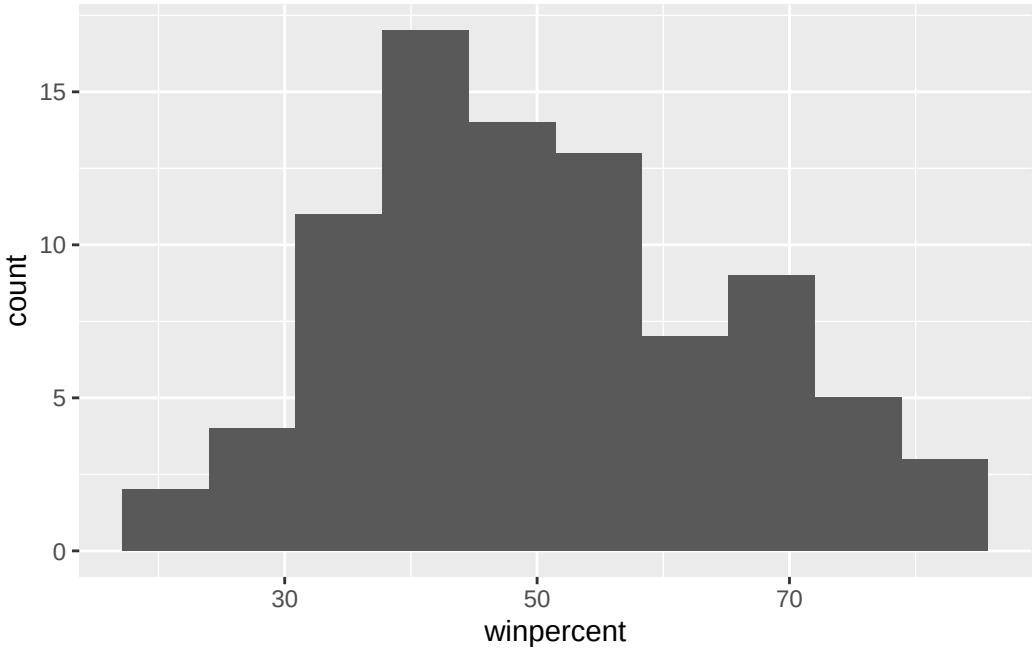
A zero here means the candy is not classified as containing chocolate.

```
hist(candy$winpercent)
```



Q8. Plot a histogram of winpercent values

```
library(ggplot2)
ggplot(candy) +
  aes(winpercent) +
  geom_histogram(bins=10)
```



Q9. Is the distribution of winpercent values symmetrical?

No

Q10. Is the center of the distribution above or below 50%?

Below 50% with a mean:

```
mean(candy$winpercent)
```

```
[1] 50.31676
```

Q11. On average is chocolate candy higher or lower ranked than fruit candy?

To answer this question I will need to "subset" (a.k.a. "select", "filter") the candy of the dataset to just chocolate candy; -get their winpercent values -calculate the mean of this

Then do the same for fruity candy and compare.

```
#Filter/select/subset to just chocolate rows
chocolate.candy <- candy[as.logical(candy$chocolate), ]

#Get their winpercent values
chocolate.winpercent <- chocolate.candy$winpercent
```

```
#Calculate their mean winpercent value
mean(chocolate.winpercent)
```

```
[1] 60.92153
```

```
fruity.candy <- candy[as.logical(candy$fruity), ]
fruity.winpercent <- fruity.candy$winpercent
mean(fruity.winpercent)
```

```
[1] 44.11974
```

Q12. Is this difference statistically significant?

```
t.test(chocolate.winpercent, fruity.winpercent)
```

```
    Welch Two Sample t-test

data:  chocolate.winpercent and fruity.winpercent
t = 6.2582, df = 68.882, p-value = 2.871e-08
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
 11.44563 22.15795
sample estimates:
mean of x mean of y
 60.92153  44.11974
```

Overall Candy Rankings

There is a base R function called `sort()` for, guess what? sorting vectors of input.

```
x <- c(5, 2, 10)

sort(x, decreasing = TRUE)
```

```
[1] 10  5  2
```

The buddy function to `sort()` that is ofetn more useful is called `order()`. It returns the "indices" of the input that qouls ewaulr in it being sorted.

```
order(x)
```

```
[1] 2 1 3
```

```
x[ order(x) ]
```

```
[1]  2  5 10
```

Q13. What are the five leaast liked candy types in this set?

I can order by `winpercent`

```
ord <- order(candy$winpercent)
candy[ord,]
```

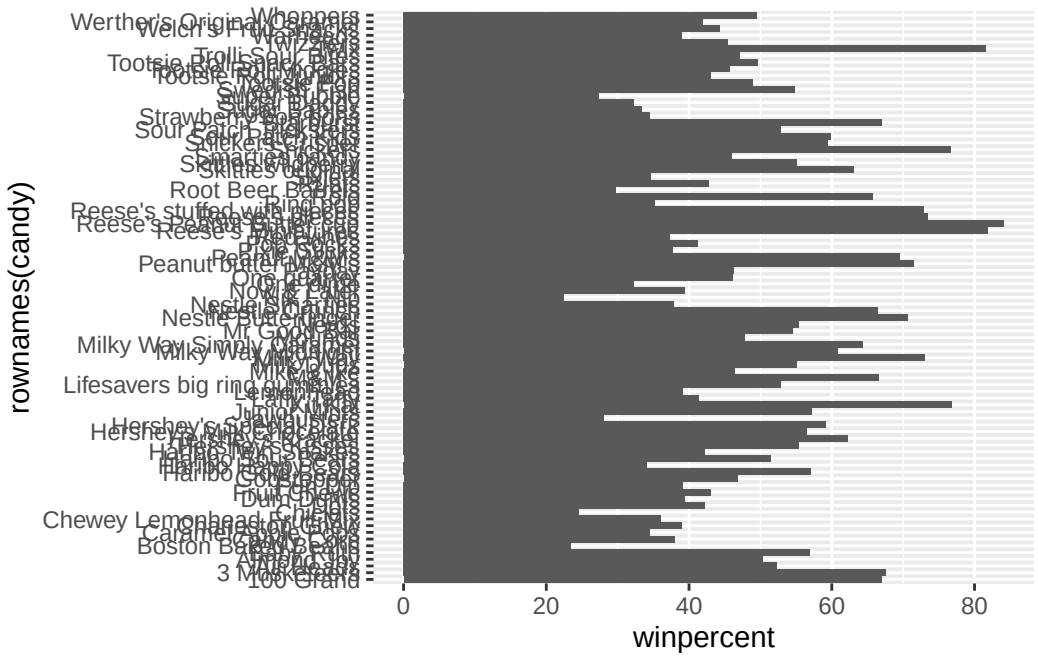
Kit Kat                          0.511   76.76860
Snickers                         0.651   76.67378
```

Q15. Make a first barplot of candy ranking based on winpercent values.

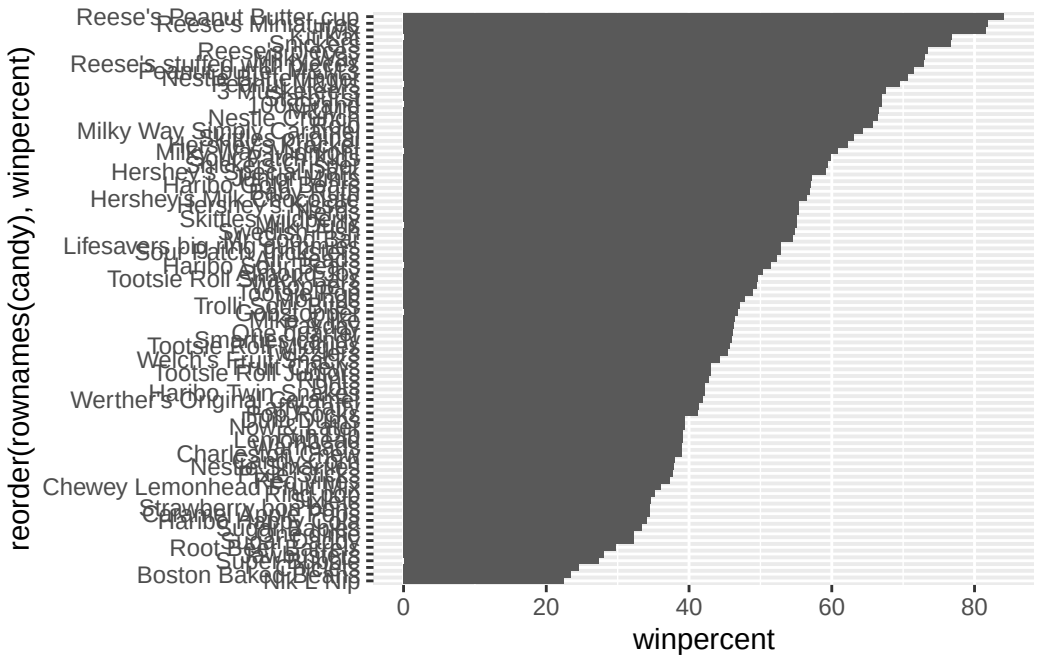
```
library(ggplot2)

ggplot(candy) +
  aes(winpercent, rownames(candy)) +
  geom_col()
```



Q16. This is quite ugly, use the reorder() function to get the bars sorted by winpercent?

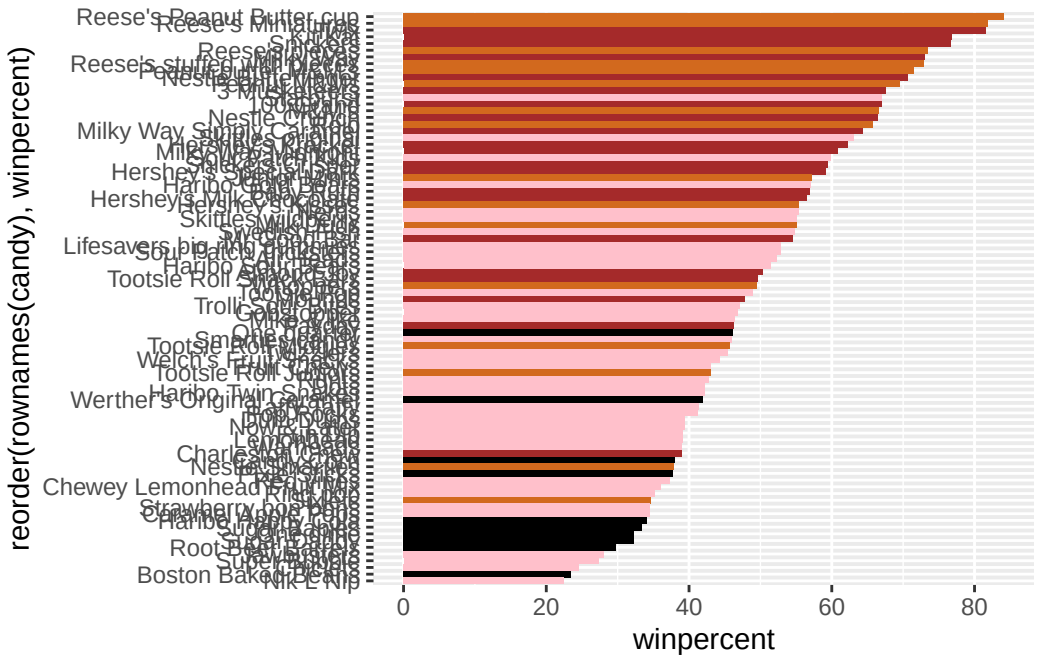
```
ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent)) +
  geom_col()
```



Q. Recolor graph:

```
my_cols=rep("black", nrow(candy))
my_cols[as.logical(candy$chocolate)] = "chocolate"
my_cols[as.logical(candy$bar)] = "brown"
my_cols[as.logical(candy$fruity)] = "pink"
```

```
ggplot(candy) +
  aes(winpercent, reorder(rownames(candy),winpercent)) +
  geom_col(fill=my_cols)
```



Q17. What is the worst ranked chocolate candy?

Sixlets

Q18. What is the best ranked fruity candy?

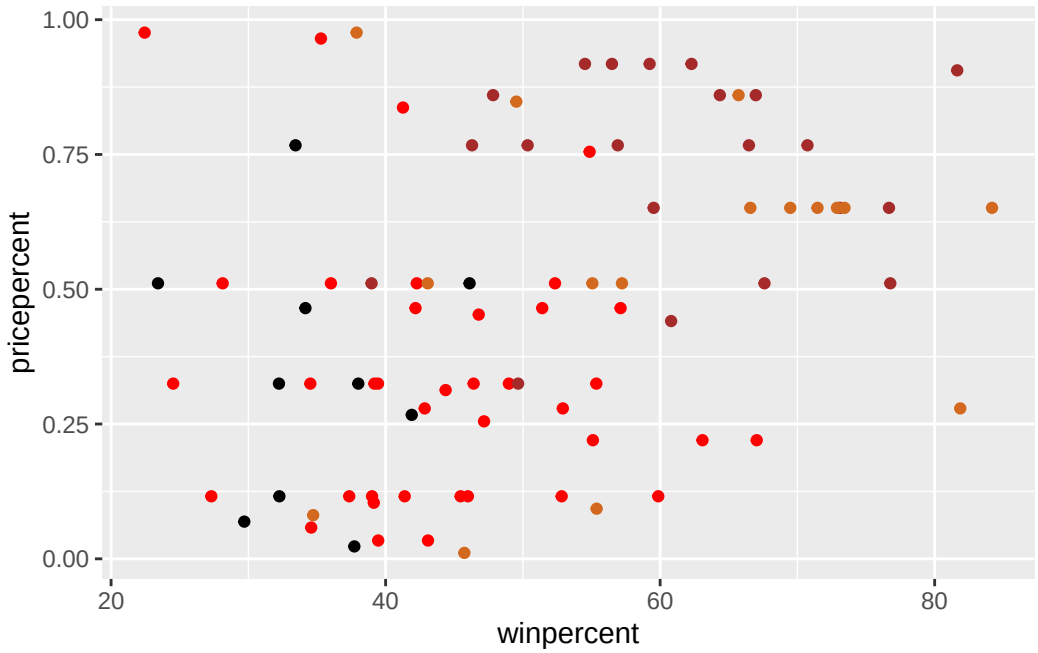
Starburst

##Taking a look at precepercent

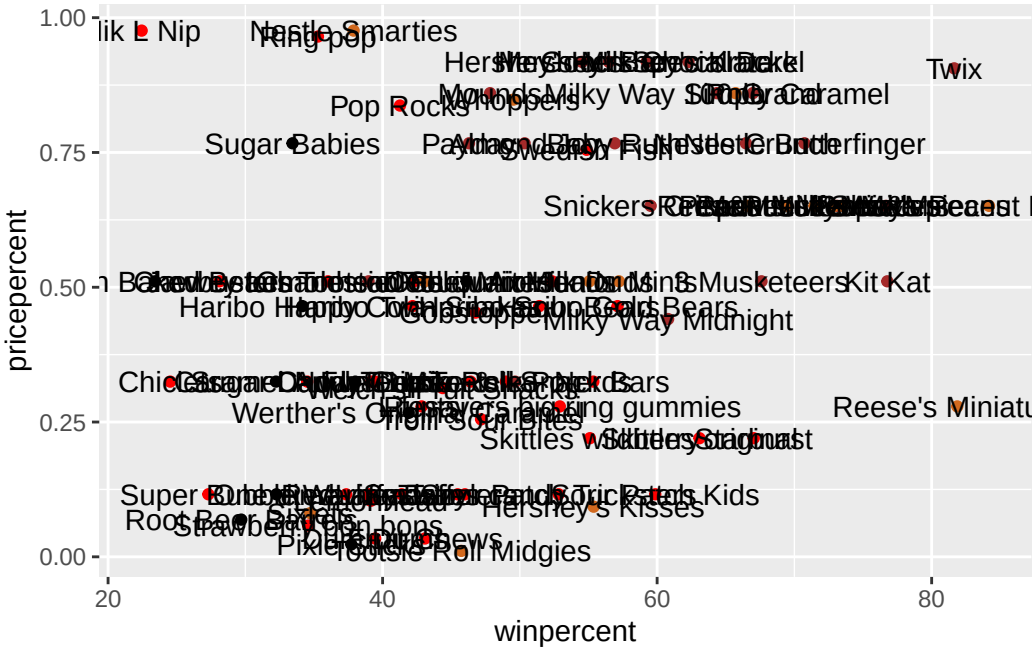
Q. What is the bes candy for the least money?

```
my_cols[as.logical(candy$fruity)] = "red"
```

```
# How about a plot of price vs win
ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=my_cols)
```



```
# Adding labels
ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=my_cols) +
  geom_text()
```

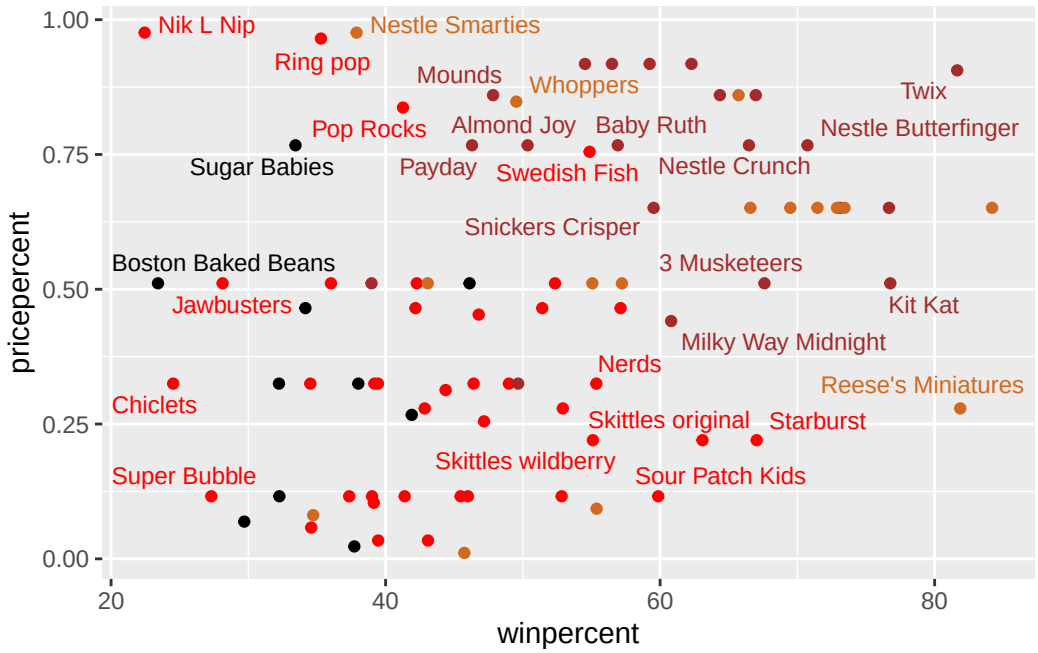


To deal with overlapping labels I can use the **ggrepel** package.

```
library(ggrepel)

# Eliminate overlapping labels
ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=my_cols) +
  geom_text_repel(max.overlaps = 7, col=my_cols, size=3.3)
```

```
Warning: ggrepel: 57 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```



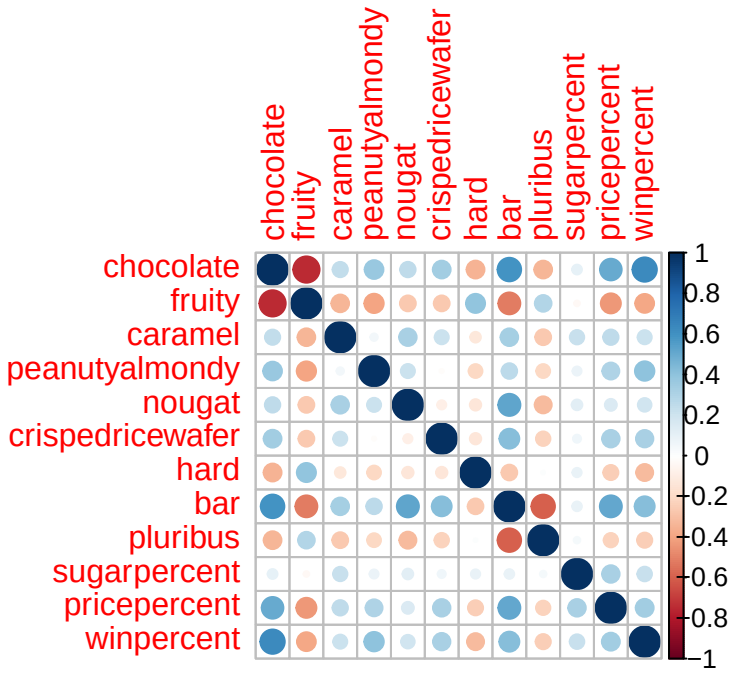
5 Exploring the correlation structure:

Pearson correlation goes between -1 and +1 with zero indicating no correlation and values close to one being very highly (ani) correlated.

```
library(corrplot)
```

```
corrplot 0.92 loaded
```

```
cij <- cor(candy)
corrplot(cij)
```



Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)?

Chocolate and fruit are anti-correlated.

Q23. Similarly, what two variables are most positively correlated?

Chocolate and winepercent or chocolare and bar.

6. Principal Component Analysis:

THe base R function for PCA is called `prcomp()` and we cans set "scale=TRUE/FALSE"

```
pca <- prcomp(candy, scale=TRUE)
summary(pca)
```

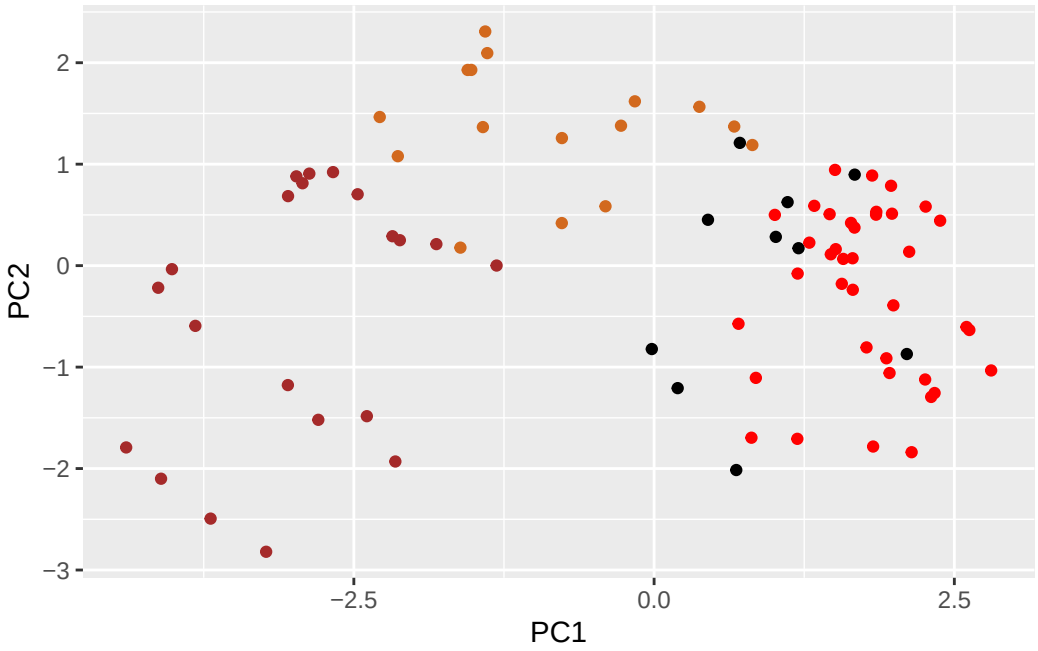
```
Importance of components:
                          PC1    PC2    PC3     PC4    PC5     PC6     PC7
Standard deviation     2.0788 1.1378 1.1092 1.07533 0.9518 0.81923 0.81530
Proportion of Variance 0.3601 0.1079 0.1025 0.09636 0.0755 0.05593 0.05539
Cumulative Proportion  0.3601 0.4680 0.5705 0.66688 0.7424 0.79830 0.85369
                           PC8     PC9    PC10    PC11    PC12
```

```
Standard deviation     0.74530 0.67824 0.62349 0.43974 0.39760
Proportion of Variance 0.04629 0.03833 0.03239 0.01611 0.01317
Cumulative Proportion  0.89998 0.93832 0.97071 0.98683 1.00000
```

The main result of PCA -i.e. the new PC plot (projection of candy on our new PC axis) is contained in `pca$x`.

```
pc <-  as.data.frame(pca$x)

ggplot(pc) +
  aes(PC1,PC2, label=rownames(pc)) +
  geom_point(col=my_cols)
```



Q24. What original variables are picked up strongly by PC1 in the positive direction? Do these make sense to you?

Fruity, hard and pluribus

```
par(mar=c(8,4,2,2))
barplot(pca$rotation[,1], las=2, ylab="PC1 Contribution")
```
